Continuous Modernization Experience

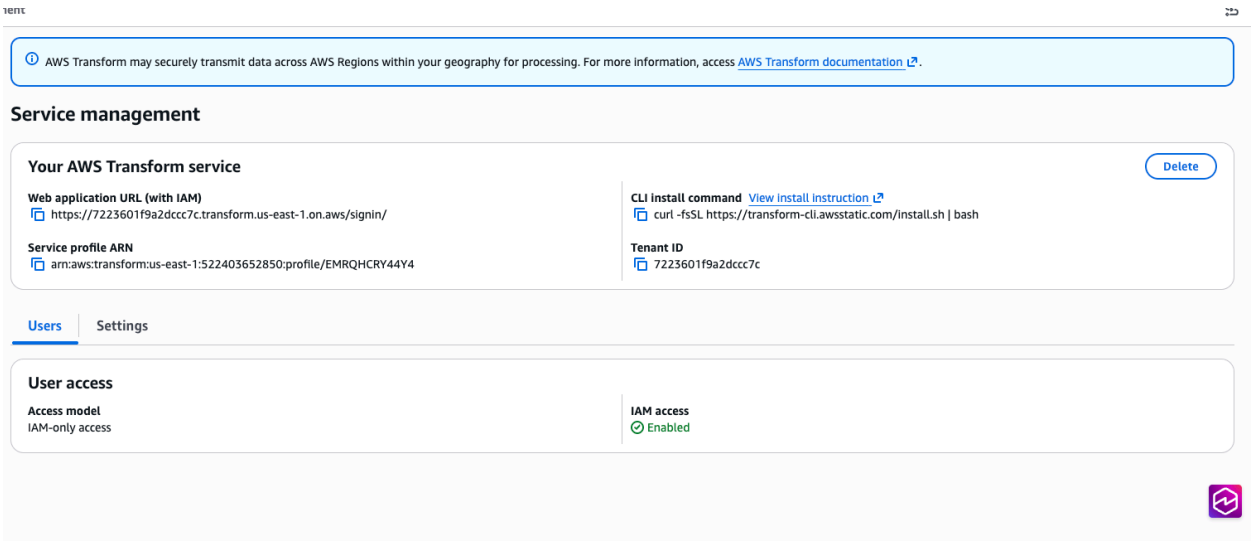

Accessing AWS Transform Application I click on AWS Transform from the search bar and I see this initial option. A left heading that tells me about AWS Transform in general, and the right heading that indicates to me that AWS Transform helps manage users and groups to use the AWS Transform Web Application or download AWS Transform CLI for custom code modernization.

There is no real direction for continuous modernization. These instructions imply to me that the web application's purpose is to manage web application users and downloading the aws transform CLI to do custom code modernization.

This is obviously not the case.

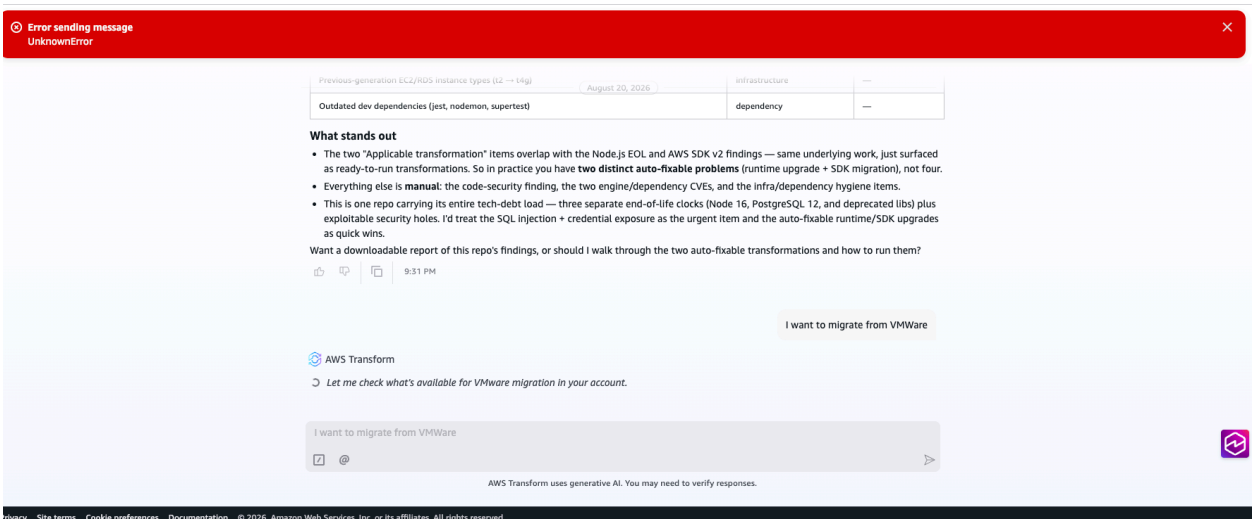

#1 Both the CLI and the web can be used for custom code modernization

#2

Why do I need to click a link to open up AWS Transform Web Application?

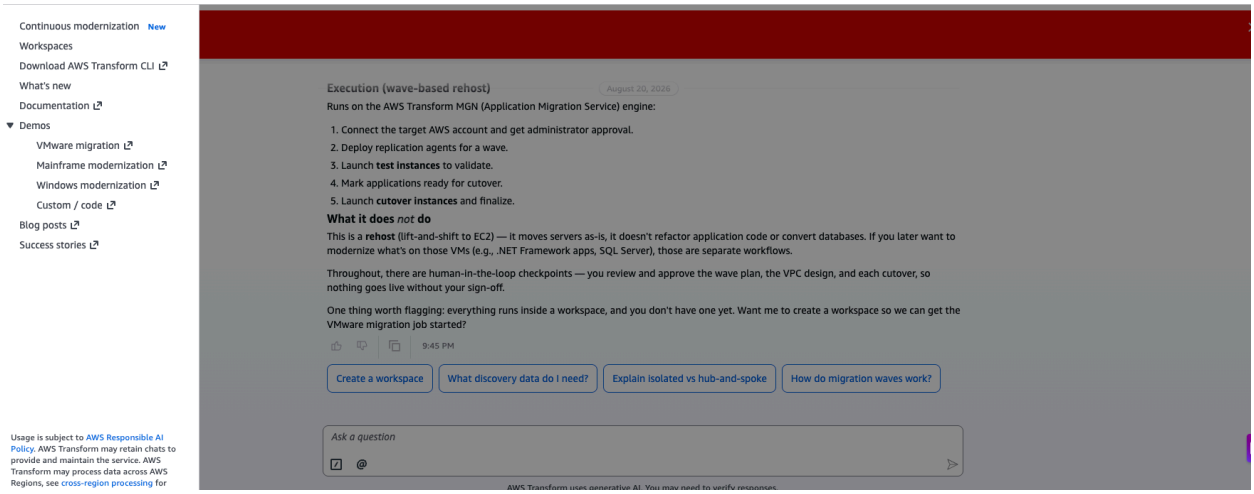

I keep getting unknown error messages when I submit a chat. Additionaly, the chat begins from the last conversation I had as well... why?

The chat seems to be used to do any other migration... why? There actually could be cases for this, but it's strange to me that in the navbar there is CM that has some level of dedication to it, and the rest of them do not have it.

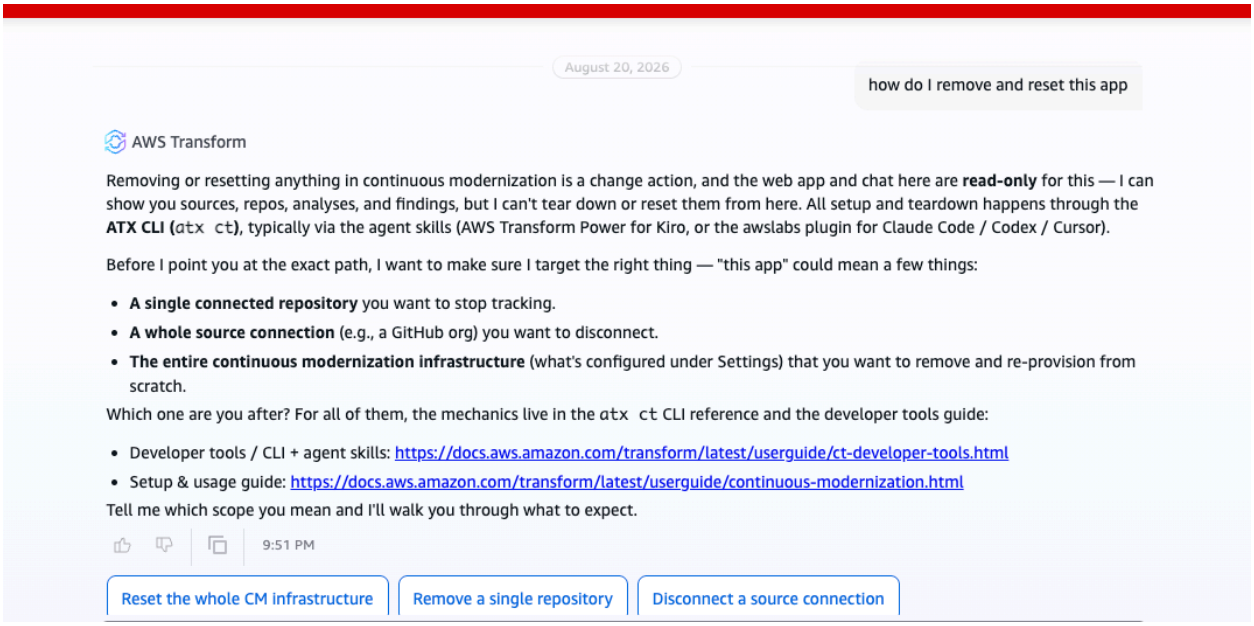

I'm confused as to the end goal of this application.

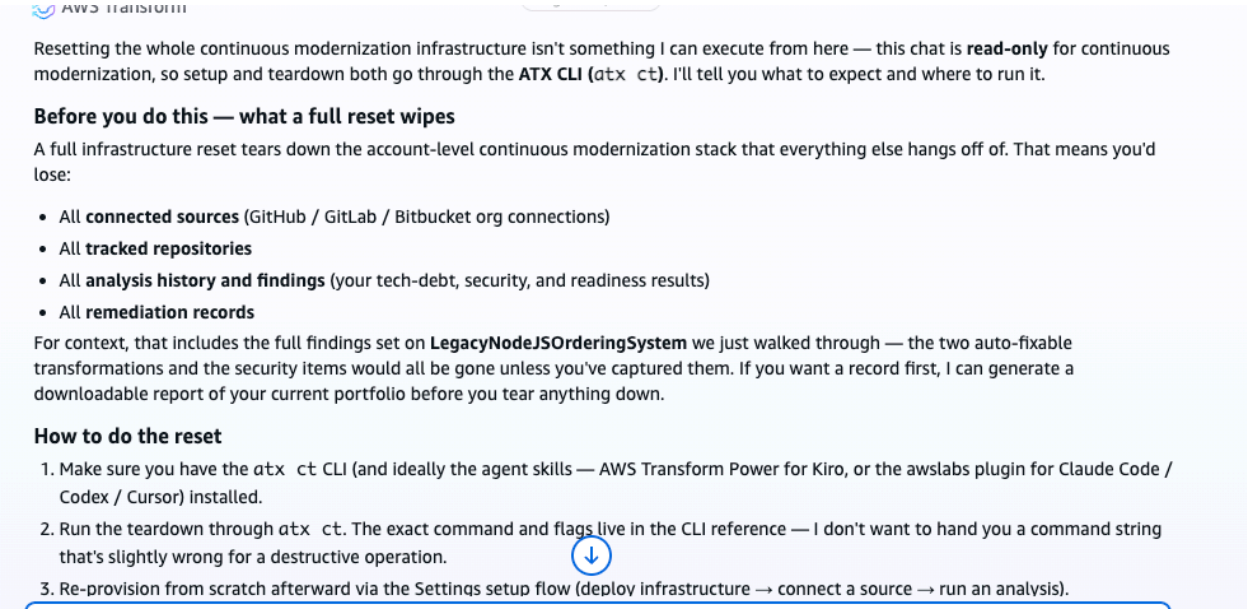

The we

Why are there demos? Blog Posts? Success Stories here. Documentation and What's new makes sense.

The documentation link takes you to https://docs.aws.amazon.com/transform/latest/userguide/what-is-service.html which does not even list AWS Custom or Continous Modernization as items on that specific page. It makes somewhat of a nod to the custom migrations however.

AWS Transform

Resetting the whole continuous modernization infrastructure isn't something I can execute from here — this chat is **read-only** for continuous modernization, so setup and teardown both go through the **ATX CLI (`atx ct`)**. I'll tell you what to expect and where to run it.

Before you do this — what a full reset wipes

A full infrastructure reset tears down the account-level continuous modernization stack that everything else hangs off of. That means you'd lose:

- All **connected sources** (GitHub / GitLab / Bitbucket org connections)
- All **tracked repositories**
- All **analysis history and findings** (your tech-debt, security, and readiness results)
- All **remediation records**

For context, that includes the full findings set on **LegacyNodeJSOrderingSystem** we just walked through — the two auto-fixable transformations and the security items would all be gone unless you've captured them. If you want a record first, I can generate a downloadable report of your current portfolio before you tear anything down.

How to do the reset

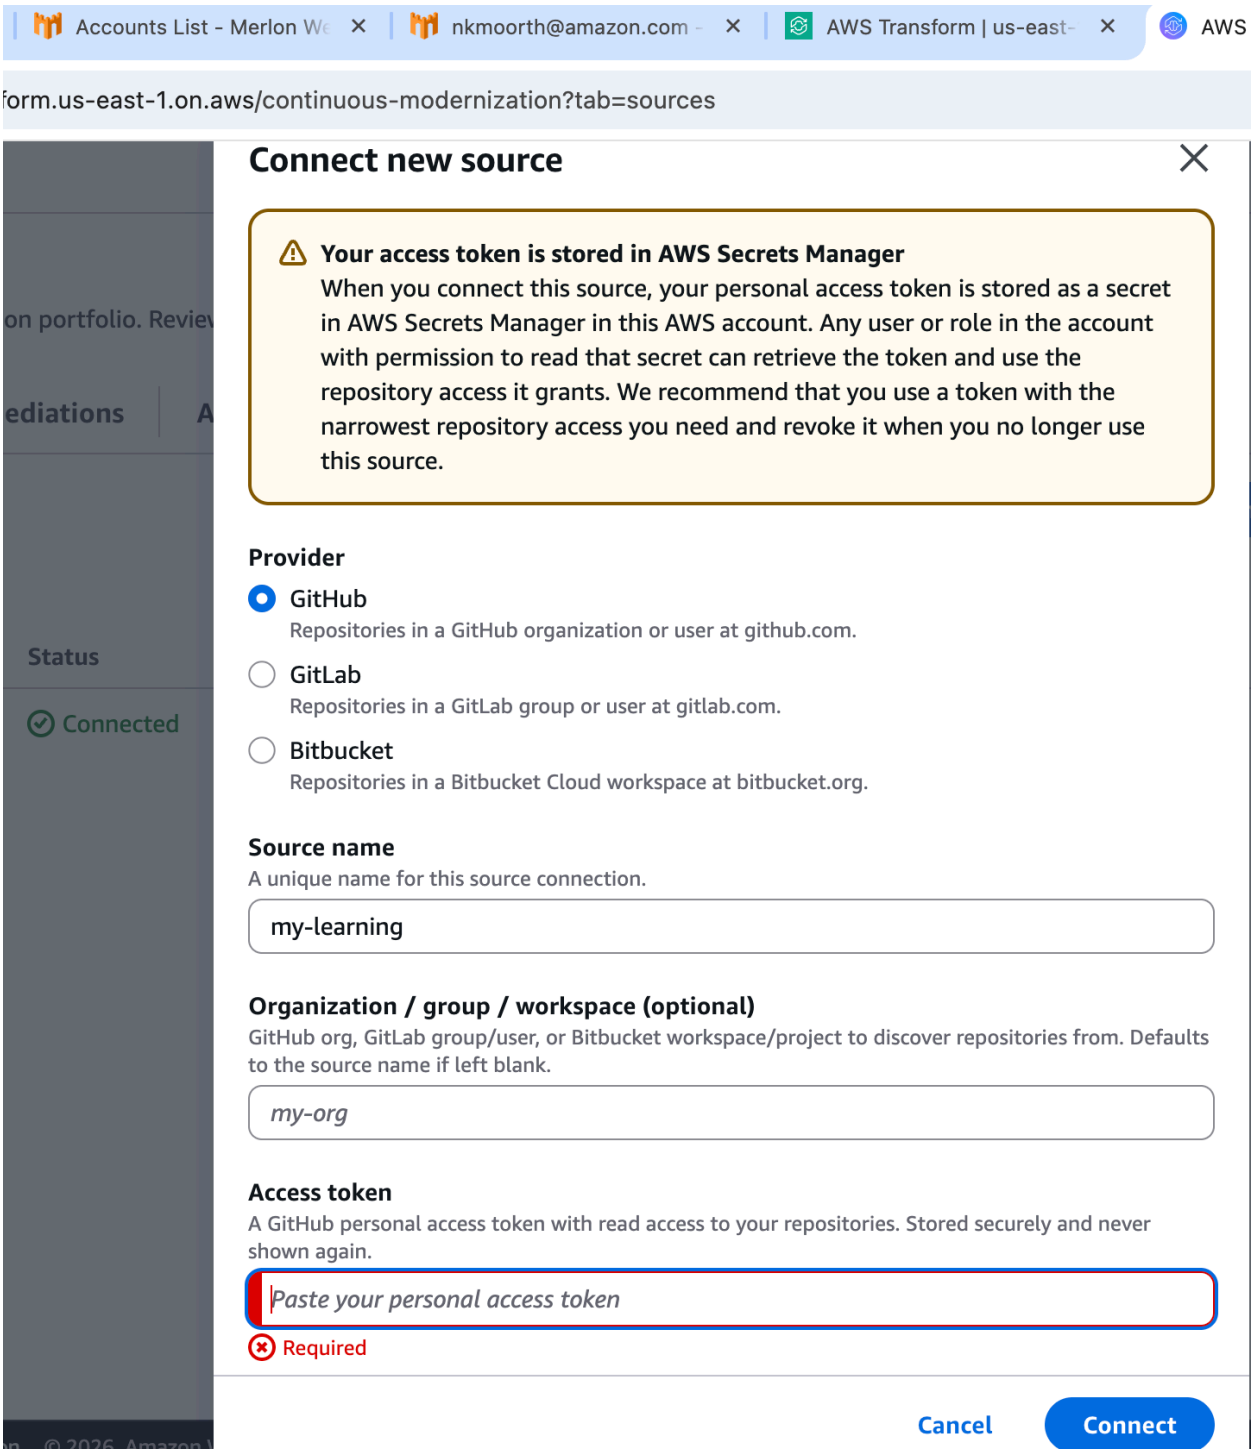

1. Make sure you have the `atx ct` CLI (and ideally the agent skills — AWS Transform Power for Kiro, or the awslabs plugin for Claude Code / Codex / Cursor) installed.
2. Run the teardown through `atx ct`. The exact command and flags live in the CLI reference — I don't want to hand you a command string that's slightly wrong for a destructive operation.
3. Re-provision from scratch afterward via the Settings setup flow (deploy infrastructure → connect a source → run an analysis).

So I can't even do CRUD operations in the chat UI right now.

The chat reply takes way too long for questions, often times gives me unknown errors.

Initally connecting resources is confusing to me.

After I set up a dashboard, it should do an analysis on the initial repo and identify and suggest which other repos are relevant

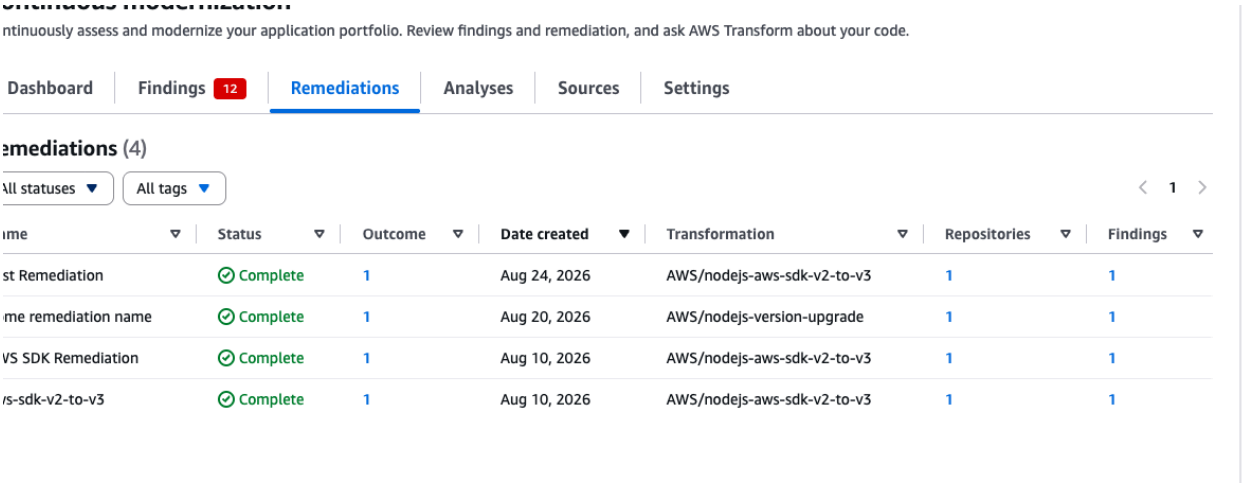

Why am I connecting my web app using a PAT? Why not OAuth?

Connecting an enterprise code estate should feel like authorizing AWS Transform, not handing AWS Transform one employee's credential.

It should be handled through: **GitHub App–based connection.**

The chat interface does not refresh nor is there a way to refresh.

Okay... but what is the branch? What happened ? How do I track where the status of the branch is?

When I connect a source, why do I have to do this again? Why everytime I have to add PAT?

I cannot create TDs or access my current TDS for either analysis or remediations.

Success for CM looks like:

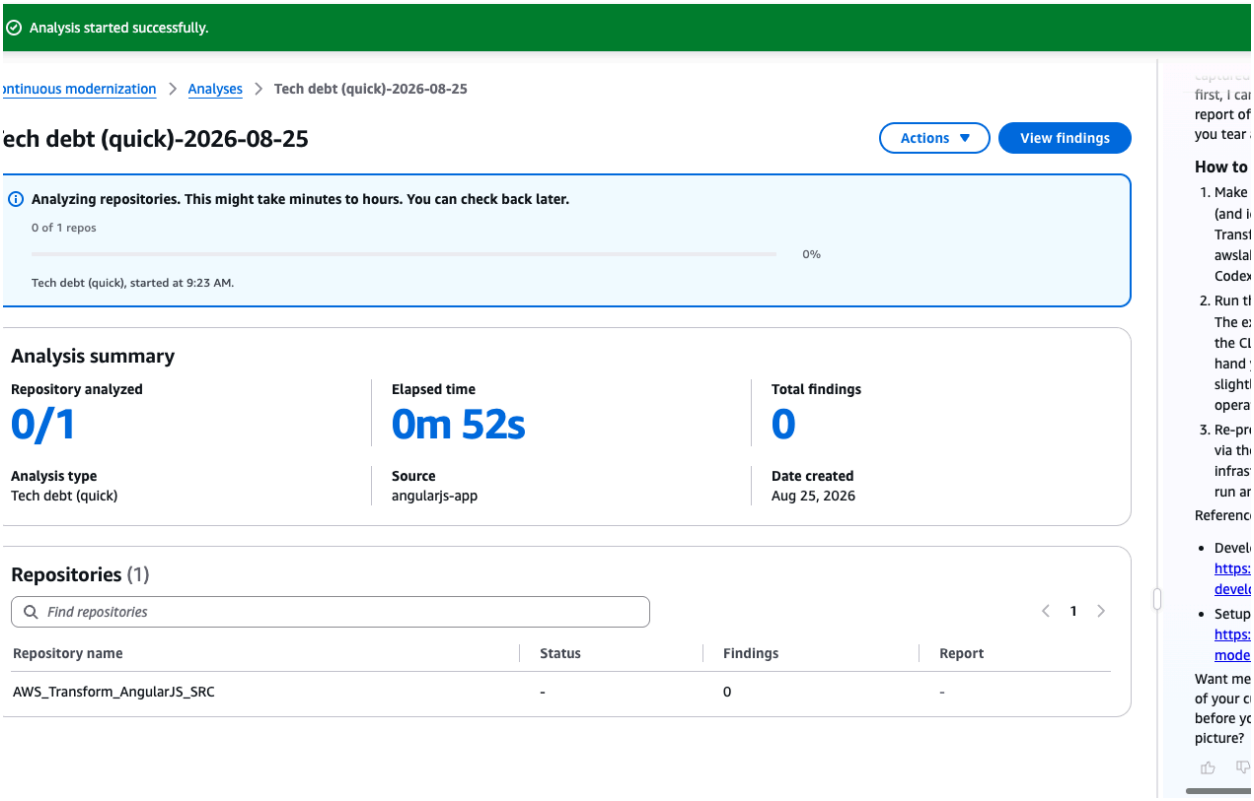

1. Easy general set up
2. Connect
3. Analysis
    1. What are the types of analysis
    2. Customizing Analysis
4. Prioritization
5. Remediate
6. Validate
7. Reassess

Connect → understand → prioritize → remediate → validate → reassess

Continous Modernization's Web Application has to respect the fact that a customer/persona that uses CM may not use AWS Transform for VMWare, Mainfraime, etc.

What i

Outdated.

When I run the analyhsis. it stays at 0% for at least 2 minutes and even longer. Even elapsed time jitters, after a few seconds it updates.

The chat bot feels very generic. I'm not sure why the chat ux is on a high level as a platform service. There doesn't seem to be an indication that customers who want to CM
